Gathering Hardware Stats is NOT Efficient

- Not a Big Deal™ when you have a small number of actions
- As systems scale to millions of rules/actions, frequent stats updates are not efficient (true for software, too!)
- Why care about stats:
  - Collecting stats every 5-10 seconds for billing
  - Maintaining SLA
  - Network (Action) troubleshooting

99 Problems and Stats is one

- Number of actions could make pulling all counters every poll period !scalable
- Tracking updated stats with bitfield of changed stats and only checked changed stats (hardware support needed)
- Speed of network + hardware stat field size could cause wrapping if polling is not frequent enough
- Push of stats block to host memory could allow kernel to have a block that is always up to date
