Zoned Storage BoF

LINUX
PLUMBERS
CONFERENCE Vienna, Austria / Sept. 18-20, 2024

Zoned storage testing - current state what remains to be done

libzbd/libzbc
zonefs
blktests
xfstests
- generic/747
- btrfs/237
- btrfs/273
- brfs/317
- f2fs/*?
- Create more generic zoned file system tests?

Non-power-of-2-zone sizes

Slava:

What situation with non-power-of-2 zone size do we finally have?

Should I consider testing SSDFS for this case? If so, do we have emulation in QEMU?

FDP and Zoned Storage

- When is FDP a better choice when doing data placement?
- When is Zoned Storage the better choice?
- What is the common ground?

- **What is the common denominator(s) we can leverage for userspace to make use of both in a good way?**
  - Explicit write life time hinting
  - In-kernel heuristics for separating data into streams/placement groups and zones..
    - Separate data based on file || directory || pid || ...?

Data placement benchmarking

Benchmarking is hard, can we share the effort in evaluating our implementations?

Can we do better than just use rocksdb / cache lib?
Can we automate?

Any active efforts in this area?
- SNIA?
- fsperf?

Thanks!
