Improving fw_devlink dependency tracking

How fw_devlink works today

- fw_devlink needs to build phandle reference graph of all the DT nodes.
- Needs to understand each DT property to find the phandle.
  - power-domains = <&**k3_pds** 36 TI_SCI_PD_EXCLUSIVE>;
  - iommu-map = <0 &**ipmmu_hc** 0 1>;
- Needs a function for each property to be able to parse it.
- List is maintained in drivers/of/property.c.

What's the problem?

- The list of functions doesn't scale.
  - Need to find and add support existing/new common bindings.
  - Too many bespoke DT properties to add them all.
- Parsing overhead
  - Each property needs to be tested against list of supported properties.
  - Increases as we add support for more properties. Already at 40.

Proposals

- Update DTC to add __references__ property to list all phandles references in a node?
  - fw_devlink can just parse __references__
- Add /plugin/ directive to base DTS files (credit: Rob Herring)
  - Forces the creation of __local_fixups__ node.
  - Lists the location of every phandle in the base tree.
  - fw_devlink can just parse __local_fixups__
- Better ideas?

Thank you!
